

Defe 19-180 Fendian

- e16-7 - Fr 55Bm capable to penetrate North ABM
+ limited range
- e16-7 poa - only pos of US + Fr nuke co-op has been reported to UK under Nuclear Agreements
- e66 pol - US have much closer relation with Fr will regard to test techniques, facilities + safety

Defe 19-182 Clock

e61 Tela/

- e77-p03 - warheads (for Chn) could be based on US Board warhead if US were prepared to release details.

Sig Ant could be more vulnerable to Central ABM than Options 14

- e78 p06 - Min range 900nm with 90% repeatability - C rsc
- If no fail-safes delayed (as proposed) then greater

- e61 poa - fine risk in sub options is minor exception

Defe 19-190 Posidon

- e20 po2 - Pos perf to Sig AB - less sensitive to improvements in R ABM
Sig Ant marginally better against Fr ABM.

- e25 po1 - increase in sea room brings a degradations in navigation accuracy

- e26 - 'possible operations or other results the which may arise because of the introduction of a British warhead into a US system' - a warhead for Poseidon (1972)

- e27 po2 - may be better for UK to pursue XRI than PoS

Defe 19-191 Clarendon

- e23 e03-1-p03 - leakage of air into ET317 at 180psr

- e03-1-p0a - paper on stratified collapse mode if IFO subjected to certain substrate and/or scenarios

Substrate premissed air/no scenarios - premissed function of liquid gas generator or opening ballast flood valve to depth.

Also note fail-safe collapse under too rapid pressurisation

- e03-1-p06 - come about for leakage from H0-177 scenario
- reported leakage for ~~some~~ US review of similar design

Ref 19-191 cont

Q of availability of round for

e05-p07-US/UK joint surveillance & proposal to extend ET317
semin like how 8 yr to 12 + pos 16 yrs.

e16 - timeline for other decisions

e17-2-p02 - 24 hr note - 2nd SSBN - 13 missiles for
Harbor

e17-2-p03 - 8 for each contains with Chn.

- safety - dangerous liquid fuels + 100 pyrotechnic devices + low
energy ignitor; leak alarm - could require scenario to
flood tube → then with missile in flooded tube -
problem of getting or unloading ~~damaged~~ damaged
missile.

e17-2-p06 - could meet NATO targets without Ch.
+ with 2 SSBNs - "we would achieve the Moscow criteria".

- argument for more nuclear imports than Ch

e17-2-p10 - max range 1919 nm

e23-1-p07 - PAC propulsion unit has to produce 3 separate
burns in ^{liquid} rocket to the entry ban (=solid motor)
+ change ^{let's say} grants when SOS exceeded.
- technical risks in UK development of solid fueled PAC two

great

e23-1-p11 - opt in 51 ashby opt (F1/5-SSBN)

e23-5-p06 - leakage of air into ET317 in SSBN launch
tube is debited by capsule pressure requirement at launch

e23-6-p01 - 16/6 f75 - test has demonstrated unhampered to the

e24-2-p02 - General Electric pushing 700 EBU for Chn

e24-2-p03 - removal of 4 decoys would result in
loss of 0.4 of a penetration; i range 1965nm

Ref 19-208

e 05-2-pol - 18ab a pol - 'well over 30 variants could be derived on bases undeveloped by ABM' with current pol. purpose of SSBN

- a) a Br contribution to the NATO deterrent in what role the missiles are assigned to SACCOM + targeted in accordance with NATO plans against mobility targets in Eastern Europe.
- b) a national deterrent force in circumstances where all NATO is not operating or supreme national interests are at stake.

— Future Operational Availability of the SSBN Force - ~~hard hitting~~

e 05-1-pol - difficulties in relying on deployment of 2nd SSBN from Harbor - /

(a) until it sailed - vulnerable to nuclear, conventional or clandestine attack

(b) An operating role which deployed on board continuously on patrol but which relied for its deterrent capability on the deployment of a second submarine from harbor would be damaging to morale. SSBN crews would know that their normal deployment was largely valueless as a deterrent until they were joined by the second SSBN. The rationale for maintaining any SSBNs at sea for long + arduous patrols must be highly questionable.

[- but answer only deb is ~~only~~ the plan - not NATO]

(c) A reinforced position could not be held indefinitely

e 05-2-pol - 2nd centre. i without the nn -

"nuclear hegemony in Europe would pass to the French. This is a situation which neither we nor the Americans would wish to allow."

To be an effective strategic deb - the SSBN force must be

(a) under national control

(b) provide an assured 2nd strike capability - ie invulnerable

(c) sufficient mobile at sea for continuous threat

(d) be capable of delivering as many warheads as are required to inflict unacceptable damage to the chosen target area

Dec 19-208 and

e 05-2-04

- by 1975 Pol rada complete \rightarrow world has to destroy SSBNs to Red to oneflank; + rada would core red by 1977

"there is no reasonable doubt that the Polaris A37 missile fired from within Russian rada core would fail to deliver warhead to the Moscow Object area;"

- IABM would deliver a missile warhead within 50/100 miles of X.

e 05-2-p07 - Options -

p08 a) abandon UK SRF b) cancel c) Sop AtB

(a) World save fac on 1yr (Sov in 8); 1/2 cuts not needed or Re \rightarrow full cuts in opt + sp cuts

World keeps Eng + Rus for SSN + SSN refts

"The prospects of such savings are alluring but the price would be the loss of the UK's special contribution to NATO; of the union against a future possible descent in the credibility of the atomic nuclear umbrella; + of the ultimate guarantee of national security against a nuclear threat."

+ for only Eng purpose; UK position NATO weaker; NATO would seek greater UK commitment

p09 - (b) world result in UK's poor weakening vs Fr

e 07-p02 - ~~cost~~ 'price' could lead to debate on whether war purpose is NATO or national.

e 12-1-p01 -

"In the light of current pressure & in the Defence Budget, to analyze what level of \rightarrow by hardly 3 warheads."

e 12-1-p06 - Pol A37 - max range 2000nm with 5'000

Sop AtB - 1975 1100

e 12-1-p08 - adjust 600 would increase CEP from 0.4nm (A37) to 1 nm or more

- (on reduced fire on targets - to give cepheus not affect XX
.. or National) - poss refer to combat bursts.

e 12-1-p13 - hardened optm - 2100nm range; (1nm-2000nm² searoon)

- lose 600km² or 1/3 of available patrol area.

harden \rightarrow Sop AtB - lose 260km² or 1/8 -
range 1975nm

Ref 19 208

- e20-1 - 3 boats on board will release max ET317s
- e28-1-p06 - removal of A soft + 2 hard decoys would save 20 kg
- p08 - 3 boats concept + release of 60 ET317s needed by 1976
- eab-0-pol - Sprintaki and SK06 - 'no capability against Sprintaki'
- eab-2-p05 - initiation of a nuclear warhead must be inhibited by 3 safety breakers which could lead to loss of substance (eg accidental shot of a gas generator system) must be inhibited by 2 safety breakers,
- eab-2-p06 - 'stalling the IHL drawings by end 1976'
- p07 - find 9 rounds, 6 for acceptance trials; first test flight as early as possible.
- eab-2-p02 - amend 'DT' to 'tritium'
- p03 - EOC32 explore - sensitive to cold ($<0^{\circ}\text{C}$) - code KU793
- for checking; also refer to Nansen design (Chernobyl)
- p06 - proposal for tests between peaceful reprocessing facilities, group SSP say that leakage of liquid fuel cannot occur - but
Centrals still concerned:
- p05 - Ch - type E fuse head & type E fuze + SR44 igniter
- eab-1-p02 - re 3 boatloads; don't do poly nor a boatload
- e50-0-pol - releasing 1 boatload of A37 warhead for breakdown for the value of warhead released £40-70m.
- e50-2-p03 - Nansen - sealing urgent imported - because the delivery need for compatibility between explosive material + rad triggers;
- e59-2 - charts of char speed / time
